1 PANEL FILTER: The panel / cylindrical air filter is commonly referred to as “replacement filter”. It is installed in the car original air-box to replace the OEM air filter. It is made of highly performing materials that allow an increased air flow combined with a more efficient filtration.

2 CONICAL FILTER: The conical filter installation requires the removal of the original air box: it is to be mounted either on the air sensor or on the intake collector. In order to have the best performance, the conical filter must be thermally insulated from any heat sources inside the engine box. In the same range, BMC has developed TW technology enabling to take advantage from the increased air flow offered by an additional filtering surface. The advantages provided by this product are as follows: increased air flow to the engine resulting in improved performance, sport sound.

3 DIA: DIA, Dynamic Intake Air system, has been redefined as “CDA junior KIT”. It shares the same working principle of CDA, i.e. the dynamic effect of air pressure, such offering an increased quantity of air to the engine and a consequent positive effect to carburetion.

4 CDA: CDA, Carbon Dynamic Air-box, is mounted on the car engine to replace the original air box. It is based on an innovative system which includes a carbon fibre air box and an air filter. CDA system takes advantage of the dynamic effect of the air produced by the car speed channelling it under pressure to the engine. Air gets to the engine at an high rate of pressure giving benefit to the carburetion. The carbon fibre air box enables to keep an high thermal insulation of the air input to the engine. The advantages provided by this product are as follows: increased air flow to the engine resulting in improved performance, sport sound, esthetical look.

5 OTA: High filtration efficiency and reduced power loss. Maximum air flow and assured filtration of the air from impurity. Besides its oval shape offering versatility in application, OTA system is equipped with a device called “Trumpet”, placed inside the OTA system on the air outlet side, which allows to further increase the quantity of air to the engine: it benefits the dynamic conveyance given by its shape. This solution limits the pressure drop along the aspiration line of the engine, maximizing the potential of the dynamic pressure deriving from the speed of the car. This air box has a sealing system suitable to guarantee the best seal between its components, such ensuring the pressure tight of this device at any rpm.

6 CRF: The Carbon Racing Filter is BMC’s new high performance sports air filter designed for road and competition vehicles. It features a 100% carbon fibre support structure with a cotton filter element. The function of the air filter is to protect the engine from elements which are present in the direct flow of air into the engine. The air intake to the engine must be as clean as possible because any foreign body can cause wear and a reduction in power efficiency. Air is an essential element for combustion: a higher quantity of air corresponds to better and more efficient combustion, which in turn corresponds to superior engine output. In fact, the BMC multi-layer cotton filter element presents a very low value of load loss (the difference in air pressure before and after entering the filtration device) whilst maintaining high levels of filtration efficiency. This is translated into an increase in both power and torque (HP/NM).

All BMC air filters are pre-oiled, and they can be washed and regenerated by using BMC regeneration kit.

BMC Air Filter – winning filters in all categories

The importance of an air filter

The explosion stroke of an internal combustion engine is the result of the combustion of fuel with a combustion supporter inside a cylinder; oxygen in the air. Keeping the importance of the function of the filter in mind it should be remembered that for the combustion of 1 Kg of petrol, equal to 1.35 litres, you need 14.7 kg of air, i.e. 12.245 litres (stoichiometric ratio 14.7:1). Air is an essential combustion element thus the greater the amount of air the better, and more complete combustion will be making the engine much more efficient. However, air entering an engine must be clean as any foreign body can cause rapid wear and lower propulsion efficiency therefore, air must be filtered, even though any type of filter creates an obstacle to air flow.

Air filter functions

The characteristics of a cotton filter can be summarised as follows: Permeability, Screening and Retention. Permeability: the filter must create the lowest possible obstacle to enable the highest passage of air. Screening: to ensure that all foreign bodies in the air are prevented from entering. Retention: the retention of all solid particles. Cotton filters are made of a multi-layer fabric soaked in oil inserted between two aluminium nets. Polluting materials in the air such as dust, rubber and other debris, all with a negative charge, are separated from the air when it crosses the fabric and are captured by the positively charged oil impregnated fibres. The filtering process is continuous and foreign particles are deposited on the fabric without blocking the air flow. Cotton filters, although expensive, offer the best results: maximum permeability plus greater retention and screening. Their permeability is measured by the "Pressure Drop", that is the difference between upstream and downstream pressure as air flow speed varies. This value, measured for cotton filters, is much lower than that of paper or sponge filters under the same conditions. Cotton filters can be reused several times after having been washed with a special detergent and re-soaked in oil.

CRF Carbon Racing Filter

The "C.R.F." Carbon Racing Filter "www.carbonracingfilter.com" is BMC's new high performance sports air filter designed for road and competition vehicles. It features a 100% carbon fibre support structure with a cotton filter element.

The CRF has been designed and produced entirely by the BMC Racing and Advanced Composite Division, which is wholly concerned with the development of air filters and aspiration systems for the racing world: Formula 1 / MotoGP One / World Superbike.

The CRF has been created from extensive BMC knowledge acquired through more than 10 years experience in the racing sector, which has brought high level results and increased performance to super-sports engines.

Air Filter: general information

The function of the air filter is to protect the engine from elements which are present in the direct flow of air into the engine.

The air intake to the engine must be as clean as possible because any foreign body can cause wear and a reduction in power efficiency.

Air is an essential element for combustion: a higher quantity of air corresponds to better and more efficient combustion, which in turn corresponds to superior engine output.

In fact, the BMC multi-layer cotton filter element presents a very low value of load loss (the difference in air pressure before and after entering the filtration device) whilst maintaining high levels of filtration efficiency.

This is translated into an increase in both power and torque (HP/NM).

Principle characteristics

1) The CRF air filter makes use of innovative technical solutions to optimize the flow dynamics of the direct air into the engine. The geometry of the CRF has been devised with the objective of using the entire available volume of the standard air-box thanks to an extended filtration surface. The result is better air flow passage in the intake phase thereby maintaining constant air-box pressure.

2) The structure of the CRF is made of carbon fibre which interfaces directly with the original air-box, providing a perfect seal and easy mounting. The structure is manufactured with pre-impregnated carbon materials which are cured in an autoclave. Thanks to this the CRF air filter presents a much reduced total weight whilst having excellent characteristics in terms of rigidity and mechanical resistance.

3) The filtering element is made of a special multi-layer filtration material in RACE configuration which is impregnated with low viscosity oil held between

epoxy-coated (to prevent oxidation) aluminium mesh. This enables increased permeability and low air flow resistance guaranteeing highly efficient filtration.

4) The CRF filter was conceived with the objective of withstanding the vibrations and heat produced in movement both in normal road and intensive track use.

5) The CRF filter, as are all BMC filters, can be regenerated and reused. Once the saturation level has been reached the filter can be regenerated through a process of washing and re-oiling using a special BMC kit.

6) The CRF air filter is a patented product with a deposited industrial model.

7) The CRF filter was created for those who require maximum return and performance from their vehicle. It is the definitive filter for those who look for **enhanced quality** and **technical development** derived directly from the world of racing.

What is O.T.A.?

It is a complete kit for engine air aspiration and filtration. This device is mainly composed of an oval-shaped air box in carbon fibre containing a cylindrical air filter with dynamic inlet. OTA kit totally replaces the original car filtration box (stock air-box). Usually the original car air boxes work in such a condition as the air is recalled by the engine in a “depression regime”, through reduced section tubes, thus resulting in high load drop along the aspiration line. The OTA device with its dynamic inlet works in a “pressure regime”, therefore it provides a constant and high rated quantity of air to the engine taking advantage of the dynamic effect of the air pressure. In addition to its oval shape, offering high installation versatility, OTA system introduces in its inner part technical solutions which optimize the fluid dynamic of the air to the engine. In particular, the innovative element called “TRUMPET”, which is situated inside the air box in the area close to the air outlet, thanks to its shape, favours and optimizes the convey of the air flow to the engine, resulting in the diminishing of turbulences. This solution reduces the pressure drop along the engine aspiration line and, at the same time, takes advantage of the potentiality of the dynamic pressure of the air caused by the speed of the moving car.

The air filter inside the air box ❶ is made of a multi layer pre-oiled filtering material which grants an high filtration efficiency against limited pressure drop in the air. The air filter has the function of protecting the engine from all the elements (debris,

sand, dust, etc...) in the air flow to the engine during the aspiration phase. BMC air filter has a very low drop (i.e. the pressure difference between the air flow at the engine side and the one at the air entrance side) in order to enable the maximum air flow. BMC air filter can be regenerated and re-used. Once the saturation level has been reached, it is possible to regenerate the filter by washing and re-oil operation performed by means of the relevant regeneration kit (see page 179).

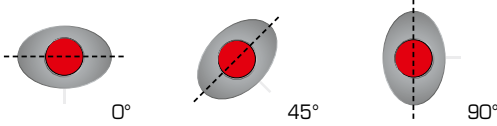

OTA kit is a universal product which can be installed in different car models. OTA kit range is featured by different air box dimensions and by the dimension of the connection parts of the car. The choice of the proper OTA model should be carried out on the base of the features of the engine to which the device will be applied and of the features and dimensions of the elements to which the device should be connected. Moreover, the kit includes the necessary accessories to its installation ❷. Besides the ones already included in the kit, BMC has available in its catalogue a large range of accessories for the installation.

Technical features

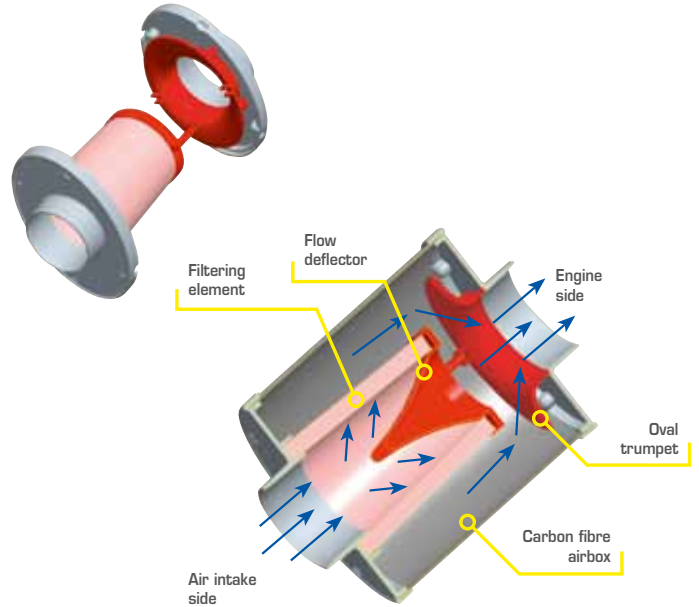

The main technical features are the following:

- 1) Oval shape of the air box designed to enable high versatility for the installation of the device.
- 2) High thermal insulation from heat sources by means of an air box in "true" carbon fibre at 5 layers.
- 3) Air filter with re-generable material which warrants an high filtration efficiency with reduced drops.
- 4) Oval Trumpet: sophisticated and designed inner system for the channelling, conveyance and increase of the air flow by introducing an innovative system/air conveyor named "Trumpet". The Trumpet, placed inside the OTA device on the air outlet side, enables to additionally increase the quantity of air to the engine by taking advantage from the dynamic conveyance given by its peculiar shape.
- 5) Air box with sealing system enabling to guarantee the best sealing among the components, such providing the best pressure tight of the device at any Rpm.

Positioning

OTA device, due to its technical and design features and to the use of racing materials can be positioned at the top both of BMC air filters catalogue and of the worldwide range of sport filtration system for road and race cars.

Advantages and benefits

The joint working of all the OTA components above mentioned make OTA a device which is suitable to supply fresh and pressurized air to the engine: this brings to better combustion and performance, consequently improving the torque values (NM) and the maximum power (HP) along the whole engine rpm. In addition, OTA kit provides a sport sound.

CDA - Carbon Dynamic Airbox

The CDA filtering system is composed of a cylindrical carbon fibre airbox containing a washable filtering element.

The choice of this composite material is due to the fact that carbon has low thermal conductivity allowing insulation from the engine heat to the aspirated air. Replacing the original airbox with the CDA, fresh air is channelled directly to the filter, thermally insulated inside the carbon airbox and then conveyed to the engine through an air flow deflector with minimum loss of power (patented system, see technical design in the following page).

The kit also contains a flexible aluminium tube (23.622 in length) to connect the CDA system to a frontal air intake. The CDA was created as a universal system fitting most kinds of car; the different applications are completed by a wide range of accessories that are necessary for the installation.

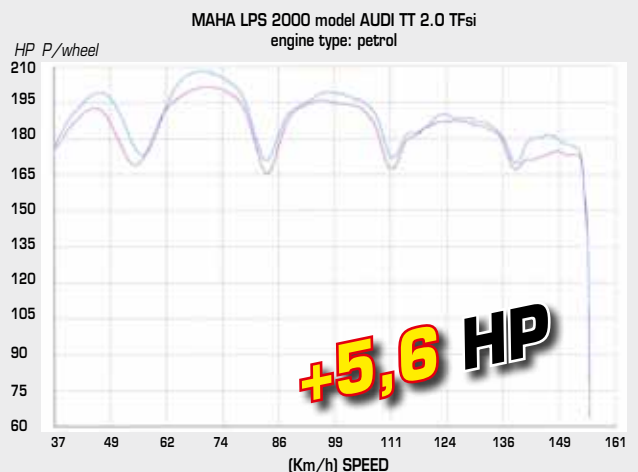

The CDA is available in two versions: the first with an external diameter of 5.118 in which is recommended for engines of up to 1600 cc. and the second with an external diameter of 5.905 in for greater displacements.

Model AUDI TT CDA
 MAX POWER (HP): **208.07** (Km/h): 112:31 TEST RANGE Km/h: 37-155

CDA - Specific kits

There is also a wide range of CDASP applications available. These are complete ready-to-mount kits specifically created for particular car models.

The special kits often derive from a universal CDA with added specifically developed pipe fittings and reduction units, while in other cases the CDASP is customised to fit from single components with special flanges, made to measure for the specific vehicle. *(see application list at pages 22 - 29).*

CDA - Advanced technology

The CDA filtration system is connected to a frontal air intake via a flexible aluminium tube.

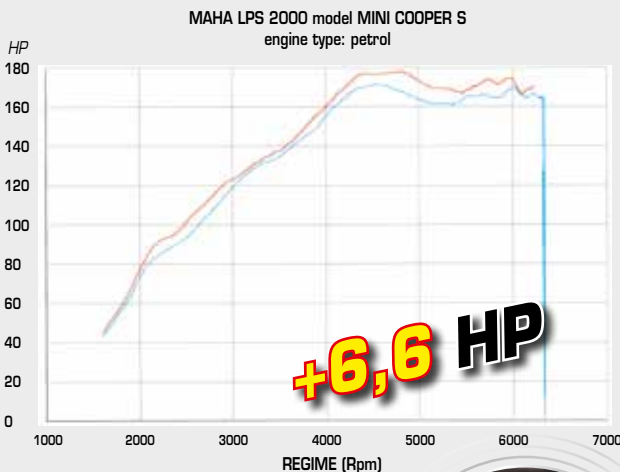

Thanks to the dynamic air intake you get a real supercharging system that conveys fresh air to the air box at a speed and capacity greater than that of traditional systems. The air flow entering the dynamic air intake is accelerated further thanks to the air flow deflector inside the carbon fibre airbox. Dynamic overboosting, greater air flow, higher pressure and colder air are the elements which help to significantly increase the performance of the engine both in terms of power and torque, as demonstrated by dyno tests carried out.

The CDA is also available in a number of special versions with specific flanges for direct connection to the air sensor or with different dimensions according to the model of the car.

DIA - Direct Intake AirSystem

Thanks to the experience gained by BMC in creating supercharging dynamic airboxes, we have developed the BMC Direct Intake Airsystem (DIA) and the Junior filtration system.

The philosophy of BMC's top range product, the Carbon Dynamic Airbox (CDA) is behind the DIA, a system that, with its particular structure, ensures that aspirated air is carried to the engine at a higher speed and capacity in respect to traditional systems, thus providing significant gains in engine performance. The DIA consists of a plastic air box containing an air flow deflector and a reusable filtering element. The universal kit also

contains a flexible tube to carry fresh air to the inside of the air box, a connector sleeve and two reducers to allow installation in standard applications.

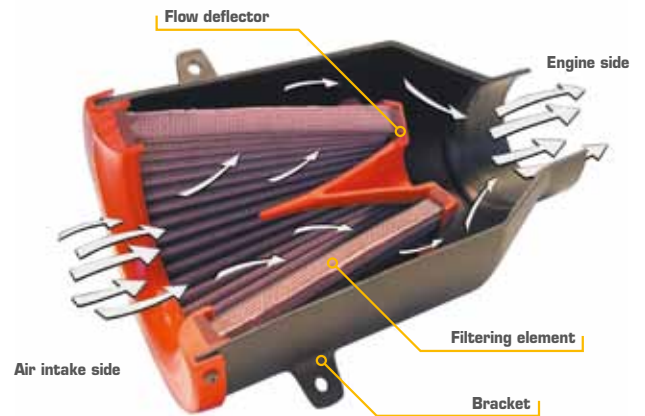

The DIA is available in two versions:

- DIA70-130 recommended for applications up to 1.600 cc.
- DIA85-150 recommended for applications over 1.600 cc.

The DIA represents a technological product available for everybody.

Conical Filters for Direct Induction

BMC conical filters for direct air intake can be installed on most types of engine by removing the original airbox. BMC direct induction conical filters are manufactured using a characteristic red rubber that allows the connection of the intake to be particularly resistant to both engine stress and heat without suffering from deformations caused by the high temperature. The special filtration mesh allows the production of filters with a power up to 700 HP without presenting problems of filter deformation.

Where necessary, various accessories such as flexible connecting hoses, support hangers, elbow connectors and reducers are available to complete the application.

BMC conical filters are available in two versions:

- **SA** (Single Air) with simple lateral air flow;
- **TW** (Twin Air) with central and lateral air flow; available in metal top and plastic top versions.

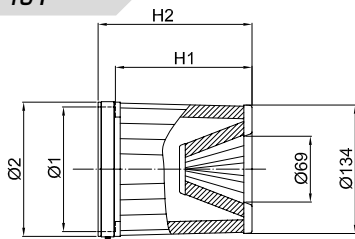

TW Twin Air

Available with metal, plastic or carbon top.

Silicon Accessories BMC

BMC silicon accessories are made using silicon for high temperatures (working temperatures from -40°C a 220°C) and are composed of 4 layers of polyester reinforced silicon with an overall thickness of 5mm. BMC connections are useful for installing direct air intake kits (conical filters, CDA and DIA) and are suitable for direct installations also to turbine and cooling systems. The silicon accessory line includes traditional straight hoses, reducers and elbows with various diameters (from 60mm to 85mm developed for use in standard applications).

The air filters

BMC air filters to replace original filters are high performance filters that can be regenerated improving air flow intake capacity compared to that obtained by traditional filters, with evident benefits for combustion quality.

BMC filters are made of a multi-layered cotton gauze soaked with low viscosity oil covered with an epoxy coated alloy mesh to ensure protection from petrol fumes and oxidization due to air humidity.

The choice of a BMC cotton filter gives the following advantages:

- improved power
- optimum performance
- engine durability
- fuel saving
- regenerable

Impurities are filtered by screening and retention being captured by the cotton fibres and held in place by the oil. This procedure does not block the passage of air thus guaranteeing long-term air filter performance stability. The filtering process is continuous and foreign particles are deposited on the fabric without blocking the air flow.

BMC air filters are produced using a "Full Moulding" system that enables the characteristic red filter to be realised from a single mould with no welded joints thus avoiding easy breakage. The rubber used in BMC air filtering systems has a long life, is very durable and has optimum adhesion characteristics to all shapes of airboxes.

**EVERY BMC
PRODUCT
IS WASHABLE
AND RE-USABLE**

Instructions for regeneration

1 Remove the larger dirt by shaking or tapping your filter gently onto a clean surface. **DO NOT** use compressed air which may damage the filtering element.

2 Distribute the BMC detergent on the filter. Allow to absorb for about 10 minutes. **DO NOT** use caustic products such as petrol or oil. **USE ONLY BMC DETERGENT.**

3 Wash your filter in cold water. Rinse well ensuring that dirt does not enter the filter pleats. **DO NOT** use high-pressure water.

4 Let in a accurate proper way your filter dry naturally away from heat sources on absorbent paper or on a clean cloth. **DO NOT** use a hair-dryer or compressed air.

5 Remove the original top from the regenerating fluid bottle. Make a small hole in the spout dispenser and screw onto the bottle. For correct oiling we recommend passing the regenerating fluid twice over every pleat on both sides of the filter.

6 The oiling procedure using the aerosol spray. Hold the spray 15 cm from the filter and spray the complete surface. Repeat the operation on both sides of the filter.

7 Allow the oil to absorb on a level surface for around 30 minutes. Remove any excess oil on the rubber and check that the filtering element is homogeneously red (Picture 7). If not, repeat the oiling process described Previously. After oiling the filter is ready to be reinstalled.
